

Add Exact Locations To Routes and the Address Book

- Route4Me always permitted route planning using exact GPS coordinates during the file upload process or using its API's
- However, when exact addresses were added through the web-interface, our system used to find the nearest rooftop and curbside location near the selected location
- Now, Route4Me users have the option of selecting if they want the system to automatically find the nearest location that is "routable" near the selected location
- These are available in all user interfaces: the route editor, multiple routes map, and the address book
